

**PROTECT YOURSELF
AND OTHERS**

I have questions about COVID-19 vaccination and pregnancy.

Should I get vaccinated against COVID-19 if I'm pregnant or want to become pregnant?

We recommend that you get the COVID-19 vaccination before or during pregnancy (ideally after 12 weeks of pregnancy). This is because severe cases of COVID-19 are much more common in pregnant women than in people of the same age who aren't pregnant. In addition, the risk of premature birth is significantly increased if you get a coronavirus infection during pregnancy.

Vaccination before or during pregnancy protects you and the unborn child.

The COVID-19 vaccination is safe if you're pregnant or want to become pregnant. The safety of all vaccines authorised in Switzerland is thoroughly checked and will continue to be monitored closely in the future.

The vaccination has no negative effect on fertility. You can have the vaccination at any point during your menstrual cycle. You can also have the vaccination if you're breastfeeding.

If you're pregnant or planning a pregnancy and have questions about the vaccine, talk to your doctor or midwife.
